

Food Market Delivery

Bringing the Best of Local Markets
Directly to Your Door

Tools & Technologies

Frontend: Flutter

Flutter is a cross-platform UI toolkit by Google that allows us to build a single app for both Android and iOS. It offers fast development with a rich set of customizable widgets and beautiful UI design.

Backend: Firebase Realtime Database & Firestore

Firebase Realtime Database allows real-time syncing of user and order data across all clients instantly. Firestore provides scalable cloud storage for structured data, ideal for complex queries and analytics.

Authentication: Firebase Auth

Firebase Authentication simplifies the sign-up/login process with email/password, Google, or other providers. It ensures secure and reliable user management across different devices.

Development Platform: Android Studio

Android Studio is the official IDE for Flutter and Android development. It offers powerful debugging, real-device emulation, and easy integration with Firebase and other tools.

Key Features

Calorie-Based Ordering

Users can input desired calorie ranges, and the app recommends food accordingly using verified nutritional data.

Dynamic Menu Management for Suppliers

Suppliers can add, update, or remove items and create promotional deals.

Real-Time Order Tracking

Customers and suppliers can track the order status live (preparing, on the way, delivered).

Geolocation-Based Suggestions

App suggests nearby food outlets based on user location and offers a wide delivery radius.

Key Features

Multi-Supplier System

Both customers and multiple registered food outlets interact seamlessly within the app.

Order on Demand (Recipe Requests)

Users can request new or custom food items not listed in the current menu.

QR Code Integration

For secure supplier verification and digital payment processes.

User Reviews & Ratings

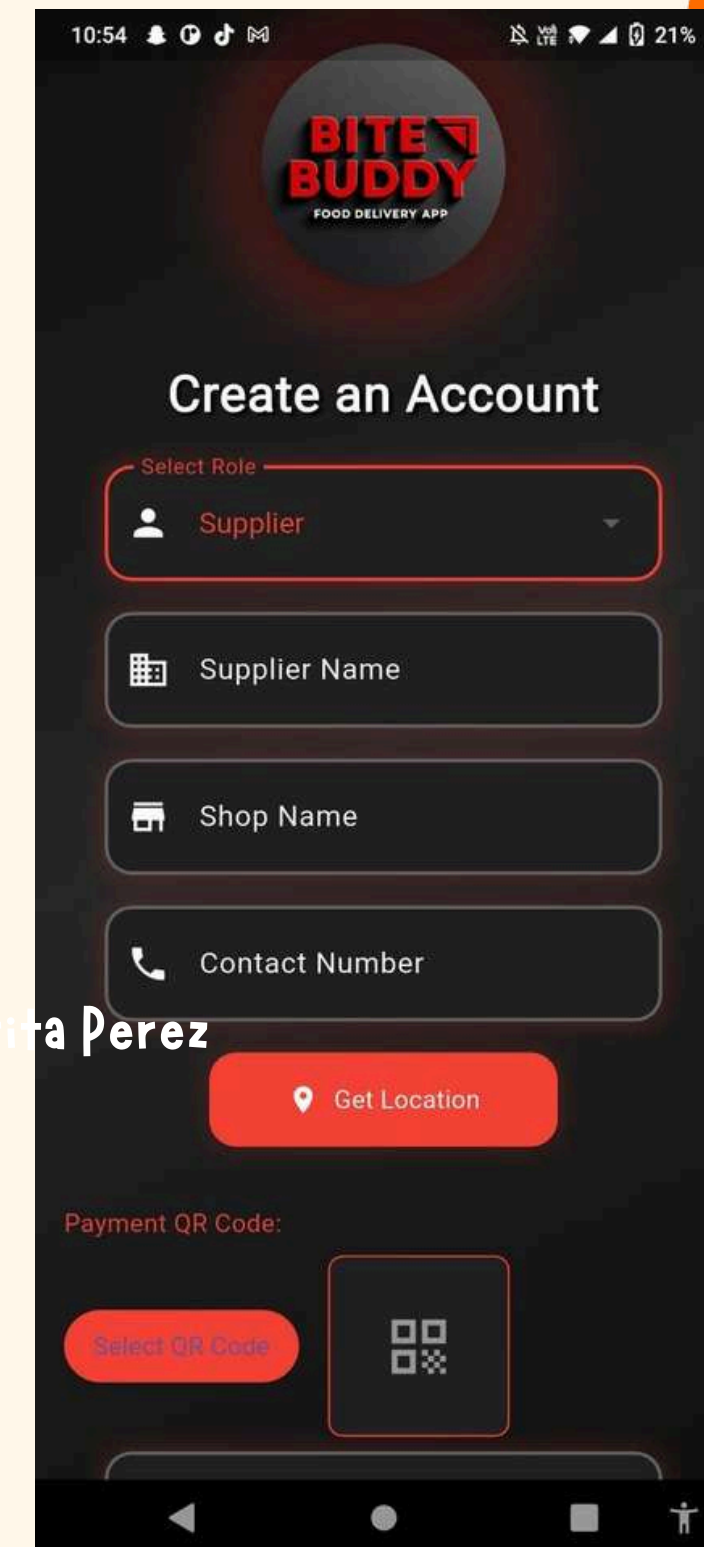

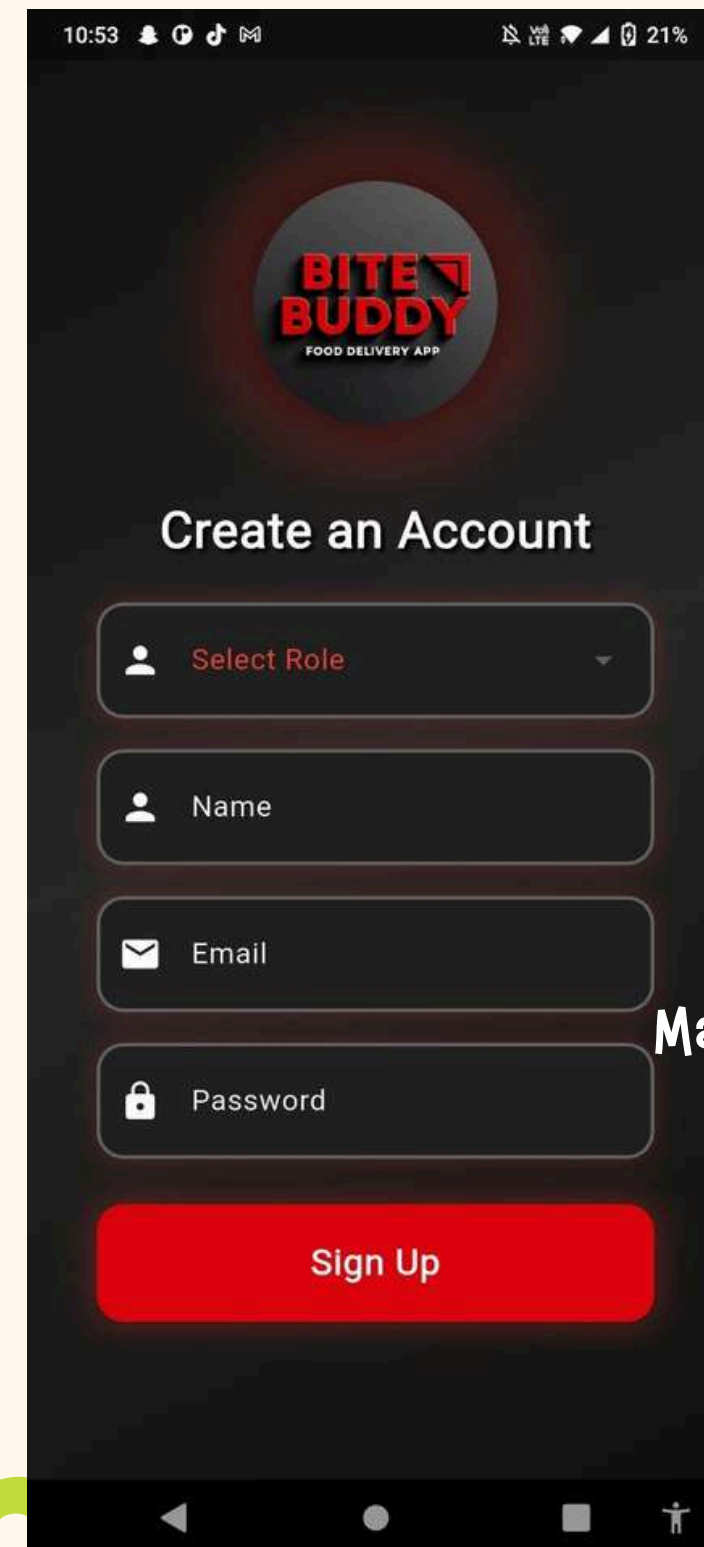

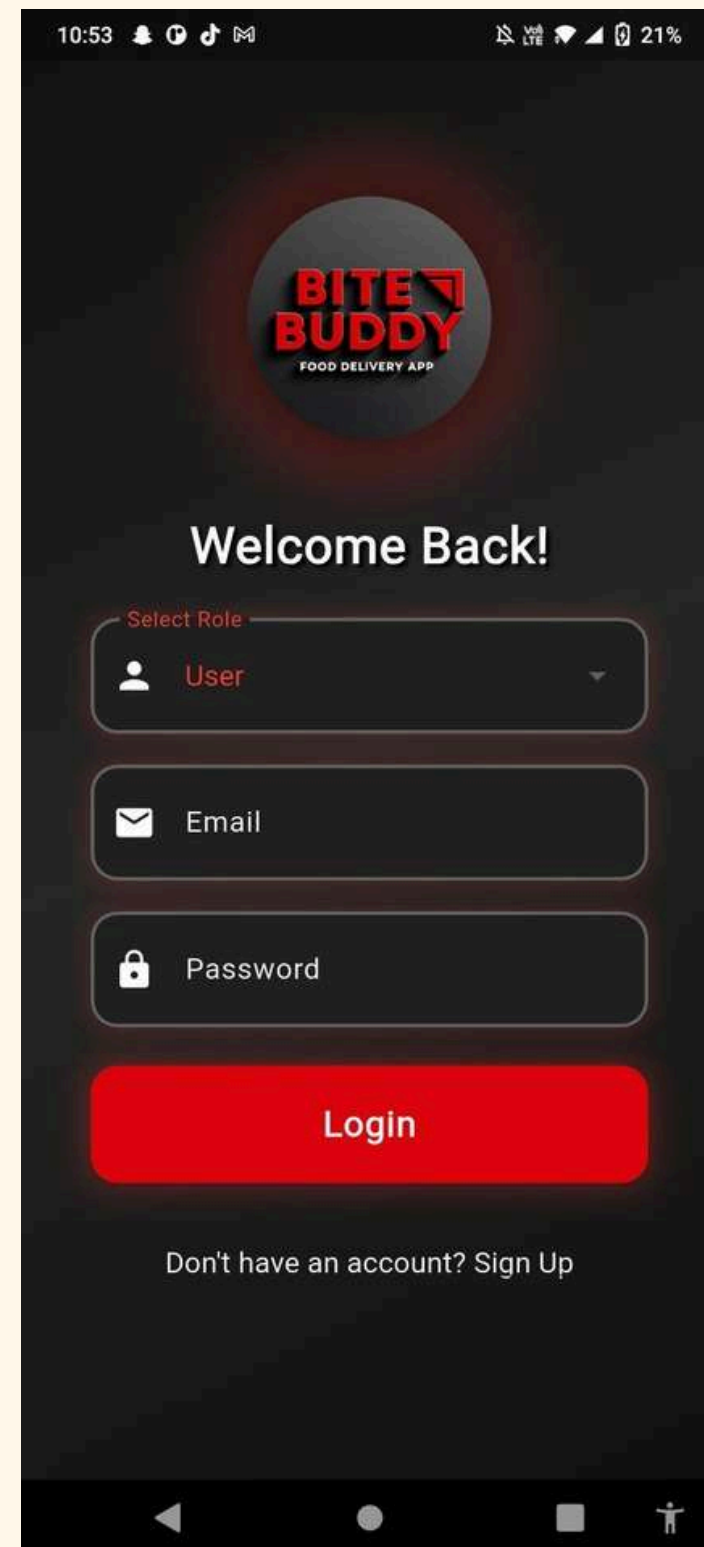

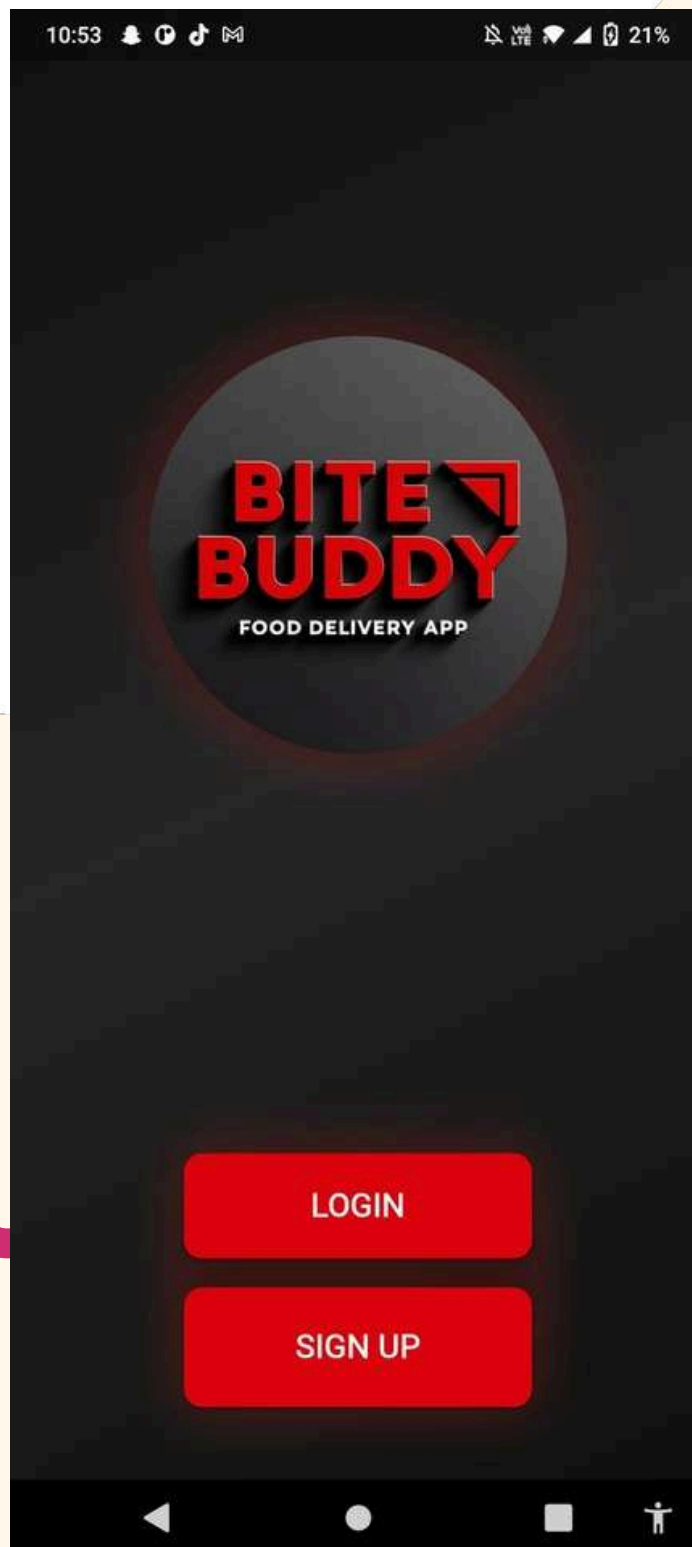

Customers can rate food items and suppliers, helping others make informed decisions.

Interactive Map Interface

Visual display of restaurant locations and delivery routes.
